

Calibrated

AQSystem is happy to inform that building a larger body of evidence now is accomplished.

In addition to classification and independent validations every AQSystem SoDAR is calibrated against a 100m IEC compliant met tower in Sweden prior to delivery to customers.

AQ510 is the only SoDAR which has this level of testing before delivery. The methodology and test site used for calibration have been approved by DNV.

The process has been in place since 2013 and 250 units have now been calibrated. In addition to this; over 100 instruments have been recalibrated with excellent results proving the robustness of both instruments and process.
